

INFORMATION SHEET BLECAVATOR

Site Soil Recycling and Ground Preparation

- **Cultivates to a depth of up to 9" (230mm)**
- **Pulverises the soil into a fine tilth**
- **Buries rock, overgrowth and debris**
- **Levels and rakes in one pass**
- **Finish is rolled leaving a firm surface**

The Blecavator is the answer to all your ground preparation challenges by carrying out five operations in one pass. It is the ideal machine for preparing both small and large areas quickly and economically.

The concept is very simple. A heavy duty contra-rotating rotor equipped with special bolt on blades, digs into the ground up to 230mm deep, lifting and throwing the soil, rocks and debris against a sorting screen mounted behind the rotor. The screen separates the rocks and debris, directing them into the bottom of the trench. The fine soil which passes through the screen is deposited over the top and levelled off. To complete the process, a rear packer roller firms up the finished areas.

Blecavator's are used extensively on golf course sites, turf farms, sports fields, landscaped areas, private gardens and estates, municipal amenity sites and many other applications which quality and reliability is essential.
